Pregnancy-related deaths

Saving women's lives before, during and after delivery

700

About 700 women die from pregnancy-related complications each year in the US.

3 in 5

About 3 in 5 pregnancy-related deaths could be prevented.

1 in 3

About 1 in 3 pregnancy-related deaths occur 1 week to 1 year after delivery.

Overview:

Every pregnancy-related death is tragic, especially because about 60% are preventable. Still, about 700 women die each year from complications of pregnancy. A pregnancy-related death can happen during pregnancy, at delivery, and even up to a year afterward (postpartum).

For 2011-2015:

- about 1/3 of deaths (31%) happened **during pregnancy**;
- about 1/3 (36%) happened **at delivery or in the week after**; and
- about 1/3 (33%) happened **1 week to 1 year postpartum**.
- Heart disease and stroke caused more than 1 in 3 deaths (33.5%). Other leading causes of death included infections and severe bleeding.
- Black and American Indian/Alaska Native women were about 3 times as likely to die from a pregnancy-related cause as White women.

PROBLEM:

Pregnancy-related death can happen throughout pregnancy and after.

Every death reflects a web of missed opportunities.

- Factors playing a part can include:
 - access to care;
 - missed or delayed diagnoses;
 - not recognizing warning signs.
- Most deaths are preventable, no matter when they occur.
- We can better identify and close gaps in access to quality care.

**Centers for Disease
Control and Prevention**
National Center for Chronic
Disease Prevention and
Health Promotion

Preventing pregnancy-related death every step of the way.

Death can happen up to a year after delivery.

Make sure pregnant women receive quality care during pregnancy and after.

DURING PREGNANCY

AT DELIVERY

POSTPARTUM

During Pregnancy: Improve access to and delivery of quality prenatal care, which includes managing chronic conditions and educating about warning signs.

At Delivery: Standardize patient care, including delivering high-risk women at hospitals with specialized providers and equipment.

Postpartum: Provide high-quality care for mothers up to one year after birth, which includes communicating with patients about warning signs and connecting to prompt follow-up care.

Leading causes of death differ throughout pregnancy and after.

- Heart disease and stroke cause most deaths overall.
- Obstetric emergencies, like severe bleeding and amniotic fluid embolism (when amniotic fluid enters a mother's bloodstream), cause most deaths at delivery.
- In the week after delivery, severe bleeding, high blood pressure and infection are most common.
- Cardiomyopathy (weakened heart muscle) causes most deaths 1 week to 1 year after delivery.

THE WAY FORWARD >>

HEALTHCARE PROVIDERS CAN:

- Help patients manage chronic conditions.
- Communicate with patients about warning signs.
- Use tools to flag warning signs early so women can receive timely treatment.

HOSPITALS AND HEALTH SYSTEMS CAN:

- Standardize coordination of care and response to emergencies.
- Improve delivery of quality prenatal and postpartum care.
- Train non-obstetric providers to consider recent pregnancy history.

STATES AND COMMUNITIES CAN:

- Assess and coordinate delivery hospitals for risk-appropriate care.
- Support review of the causes behind every maternal death.

WOMEN & THEIR FAMILIES CAN:

- Know and communicate about symptoms of complications.
- Note pregnancy history any time medical care is received in the year after delivery.
